Year in review: Treatable traits in COPD rehabilitation

Aims : Chronic obstructive pulmonary disease (COPD) is a heterogeneous and complex disease with respiratory and extrapulmonary characteristics (also known as treatable traits). Identification and treatment based on treatable traits in multiple settings may ensure for a greater personalized approach in COPD treatment including pulmonary rehabilitation both in stable phase and acute exacerbations. Emerging evidence suggests that treatable traits model (based on symptoms beyond dyspnea and physical, emotional and social manifestations) may improve relevant outcomes in patients with COPD. Interdisciplinary pulmonary rehabilitation may improve treatable traits and ensure more personalized approach for the treatment of COPD.

Year in review: The positive downside of COVID pandemic on advances in thoracic surgery in 2021

Aims : to present the evolution of minimally invasive surgery for complex and extended lung resections during COVID pandemic; The advances in anaesthesiologic techniques has brought to perform non-intubated video-assisted thoracoscopic surgery under combination of erector spinae plane block and thoracic paravertebral block. Comparative efficacy of stereotactic body radiotherapy (SBRT) and surgery in the treatment of patients with non-small cell lung cancer (NSCLC) remains a hot topic in thoracic oncology. Immune checkpoint inhibitors in metastatic NSCLC are being rapidly tested in clinical trials for the treatment of early-stage NSCLC in combination with surgery. The care of patients with surgically resectable epidermal growth factor receptor-mutated lung adenocarcinomas shows the deep collaboration between medical and surgical thoracic oncology in the neoadjuvant setting. In lung transplantation the available pool of donor lungs could be expanded , using ex-vivo lung perfusion (EVLP). Shorter length of stay following minimally invasive thymectomy for stage I through III thymoma, compared with open thymectomy, without increased rates of margin positivity, perioperative morbidity, or decreases in overall survival has been demonstrated.

Year in review: Antibiotics in lower respiratory tract infections in children

Antibiotics for CAP: how much, how long?

Aims : Respiratory tract infections are extremely frequent in (young) children and are amongst the key reasons for outpatient clinic and ER visits, and hospital admissions.

Its is not always easy to differentiate between uncomplicated lower respiratory tract infection and community acquired pneumonia and between viral and bacterial infections. Frequently antibiotics are prescribed, which may always be useful and may cause increased antibiotic resistance.

Recently, 2 RCT on antibiotic use in lower respiratory tract infections and CAP in children addressed the question if antibiotics are useful (for lower RTI) and if prescribed (in case of suspicion of CAP) what would be the best dose and duration of treatment. In this year in review recent literature, including these 2 RCTS, will be discussed.

Year in review: Air pollution and interstitial lung diseases

Aims : to describe the association between air pollution and various diseases and research on the topic; To understand how air pollution actually impacts health by modulating several important cellular functions; to present some recently, discovered evidence about air pollution-induced epigenetic changes, which are linked with the aetiology of various human diseases. Among several epigenetic modifications, DNA methylation represents the most prominent epigenetic alteration underlying the air pollution-induced pathogenic mechanism. Several other types of epigenetic changes, such as histone modifications, miRNA, and non-coding RNA expression, have also been found to have been linked with air pollution.

Clinical Research Collaboration: Pulmonary haemodynamics during exercise: Research Network registry

PEX-NET CRC

Aims : From a theoretical perspective, pulmonary haemodynamics during exercise may be suitable for detecting early forms of cardiac and pulmonary vascular disease. This concept is supported by data from several small studies. However, the prognostic and differential-diagnostic relevance and additive value of exercise vs. resting haemodynamics has not been evaluated in a large study. PEX-NET is an international registry with a retrospective and a prospective cohort, enrolling patients with exercise pulmonary haemodynamics. An international steering committee has defined the inclusion and exclusion criteria. Detailed clinical and haemodynamic data derived from clinically indicated exercise right heart catheterisations of patients with suspected or manifest pulmonary hypertension have been transferred into a central database. Participants of this session will learn how resting and exercise haemodynamics may affect survival, why this is important and what the open questions are. This will explain why a large study investigating the prognostic parameters was needed.

Clinical cases: Lungs on fire: Pulmonary vascular diseases?

Aims : To facilitate the presentation of real-life clinical cases as part of an interactive session. Cases vary in difficulty and may require differential diagnosis. This session is led by two discussants who will present cases submitted by respiratory health professionals to a panel of experts and will drive the discussion in a step-by-step approach, encouraging dialogue and reflection among the panel who have no prior knowledge of these cases. As the cases are discussed, the discussants will invite the audience to participate in determining which diagnostic and therapeutic options would be best for these patients.

Symposium: Reflections from the 2022 Lung Science Conference

Aims : The ERS Lung Science Conference is at the forefront of basic and translational respiratory science, and it is an essential event for budding respiratory researchers looking to boost their career. It offers a unique opportunity to network with peers from across the globe and aims to present cutting-edge abstracts on novel experimental lung research. The Lung Science Conference 2022 took place on March 10–13 in Estoril, Portugal with the following overarching theme: “Mucosal immunology of the lung: Balancing protective immunity and chronic inflammation”. This session features a selection of scientific presentations that were given at this conference. In addition, the session highlights the winners of the William MacNee Award for young presenters (40 years old or less at the time of the Conference) who submitted an outstanding abstract, and of the Geoffrey Laurent Award for the Best Oral presentation.

Mini symposium: Deconstructing the developing lung at the single cell level to determine phenotypes and cell-specific targets of bronchopulmonary dysplasia

Aims : to contrast and differentiate cell-specific changes and cell-cell interdependency in the pathogenesis of bronchopulmonary dysplasia (BPD) compared with normal lung development, to provide new phenotype-directed and cell-specific targeted strategies for the prevention and treatment of BPD using systems biology approaches; to define the evolution of lung cell heterogeneity and transcriptomic diversity at single-cell resolution across late lung development; to differentiate phenotypes and endotypes of BPD using transcriptomic approaches together with clinical characteristics; to contrast individual cell types and their proportion in phenotypes of BPD using scRNASeq; to identify cell-cell communication and interdependency by combining systems biology with phenotypes of BPD; to describe new preventive and therapeutic strategies with cell-targeted approaches; and to decipher innovative avenues to protect and regenerate lungs through integration of transcriptomics, proteomics and individual risk. This symposium will not only compare new cellular and molecular insights into the origins of different phenotypes of BPD, but also contrast cell-cell interaction and interdependency in healthy lungs and phenotypes of BPD. Beyond the novel mechanistic insight, the speakers will also describe exciting new therapeutic strategies such as cell-targeted therapy and how the use of combined systems biology will drive precision medicine.

The closing symposium of the discovAIR H2020 project

Aims : to empower the participants to use the Human Lung Cell Atlas for their own translational or basic research. To achieve this, the hot topic symposium at ERS2022 will introduce the Human Lung Cell Atlas, provide examples of the use of the Atlas, and illustrate the value of the Atlas for basic and translational research into lung diseases. After this symposium, the participants will be able to find the Human Lung Cell Atlas, to access the Atlas for gene- or cell-type-oriented queries for their own research activities, to use the Atlas for harmonised cell-type annotation of their own datasets and to contrast their own data from lung disease samples to the universal healthy reference present in the Atlas.

Clinical cases: Lungs on fire: Interstitial lung diseases?

Aims : To facilitate the presentation of real-life clinical cases as part of an interactive session. Cases vary in difficulty and may require differential diagnosis. This session is led by two discussants who will present cases submitted by respiratory health professionals to a panel of experts and will drive the discussion in a step-by-step approach, encouraging dialogue and reflection among the panel who have no prior knowledge of these cases. As the cases are discussed, the discussants will invite the audience to participate in determining which diagnostic and therapeutic options would be best for these patients.

Session

14:15 - 15:45

Symposium: Asthma: confusion in diagnosis, recognising comorbidities and understanding pathophysiological connections

Aims : to inform clinicians and researchers about the latest updates in significant asthma comorbidities and pathologies that mimic asthma and contribute to difficulties with diagnosis and treatment; to describe in particular conditions that mimic asthma, such as vocal cord dysfunction and dysfunctional breathing, and significant comorbidities, such as chronic rhinosinusitis, vasculitis and eosinophilic granulomatosis with polyangiitis (EGPA); to assess the importance of small airways in asthma.

Method(s) : Cell and molecular biology Epidemiology Public health

Tag(s) : Translational

Target audience : Adult pulmonologist/Clinician, Clinical researcher, General practitioner, Medical Student, Nurse, Paediatrician, Patient, Physician in Pulmonary Training, Physiologist, Radiologist, Respiratory physiotherapist, Scientist (basic, translational), Respiratory therapist

Hot topics: Occupational COVID-19: current and future impact

Aims : To present the latest evidence on the occupational risk factors for COVID-19 in support of a global recognition and compensation of COVID-19 and long COVID-19 as new occupational diseases; to present an international overview of the most adversely impacted and best studied occupational groups, in particular healthcare workers (HCWs); to discuss how occupational health services could be a privileged observatory to study and manage the COVID-19 pandemic because of their key role in implementing preventive measures, especially vaccination programmes, administrative and engineering controls, personal protective equipment and health surveillance and management of COVID-19 cases, including testing, contact tracing and return to work of long COVID-19 cases; to seek to identify research needs in relation to risk for occupational groups other than HCWs, especially among the most vulnerable social categories, such as migrants, to estimate the true occupational health burden of COVID-19, thereby providing effective and efficient governmental mitigation policies to prevent the associated public health burden and increase preparedness for future pandemics.

Postgraduate course: PG1 Part I: Cardiovascular and neurological consequences of obstructive sleep apnoea: an update

Aims : to summarise the current knowledge of the many clinical faces of obstructive sleep apnoea (OSA) characterised by a variable degree of daytime sleepiness, gender differences of OSA symptoms and differences in the presence of comorbid insomnia, resulting in various comorbidities. It will cover the heterogeneity of OSA and its cognitive outcomes, especially in terms of attention and executive functions, and the potential bidirectional relationship with dementia, focusing on early identification, prevention and treatment strategies. The physiological and biochemical mechanisms connecting OSA with metabolic syndrome and diabetes, clinically meaningful phenotyping, improved prognosis and personalised treatment will be covered. The impact of the severity of OSA on the risk and outcomes of cardiovascular diseases and evidence of the impact of OSA treated with or without continuous positive airway pressure (CPAP) on morbidity and mortality outcomes will be discussed. The challenges facing sleep medicine regarding the important effect of CPAP on patient outcomes and the role of compliance will be highlighted.

Aims : to discuss the large volume of high-quality trial data being published about pleural disease, including phase III trials in several subspecialty areas and updated international guidelines that are due to be published in early 2022. In terms of malignant pleural effusion, participants will be able to select the optimal diagnostic strategy, including thoracoscopy and direct-to-biopsy approaches, and explain the proven advantages and disadvantages of different management options to facilitate patient-centred, evidence-based care. In terms of pleural infection, participants will be able to correctly diagnose and identify patients requiring drainage, adjunctive intrapleural therapies and referral for surgery, deploy risk prediction scores and explain relevant translational and antimicrobial data. In terms of pneumothorax, participants will be able to differentiate between patients requiring admission and those suitable for ambulatory management, based on recent phase III trials, and identify the importance of familial pneumothorax and ongoing trials, including those involving the use of suction. In terms of mesothelioma, participants will be able to select optimal diagnostic and treatment strategies including first- and second-line immunotherapy and learn about the role of regional multidisciplinary teams and options for patients with early-stage disease, including radical surgery and ongoing clinical trials.
